

Project Story

The app has a highly balanced user ecosystem, but there are opportunities to improve engagement and retention through segmentation rather than relying on broad demographic or subscription assumptions.

The most important findings are:

1. Average session duration is almost identical across Android and iOS.
2. USA leads country-level engagement, but the difference across countries is very small.
3. The 35–44 age group has the highest sessions/day.
4. Free, Trial and Premium users are almost equally represented.
5. Churn risk is surprisingly similar across subscription types.
6. Push-notification interaction is distributed across 0–9 clicks.
7. Monthly activity is relatively stable except for the final partial-looking month.
8. App versions 1.2 and 2.1 have the largest user populations.
9. Average user rating is around **2.99/5**, indicating considerable room for improving user satisfaction.
10. Engagement Score is driven primarily by **session frequency and session duration**, rather than the other components in this particular formula.

Recommended business actions

- 🎯 Build **behavior-based user segmentation**.
- 🔔 A/B test push-notification frequency and content.
- 🔄 Optimize the **Free → Trial → Premium conversion funnel**.
- ⚠️ Identify high-engagement users with high churn risk for targeted retention campaigns.
- ⭐ Investigate why average user rating is only around 3/5.
- 📱 Monitor app-version adoption and encourage users toward supported versions.
- 📊 Track engagement by multiple dimensions simultaneously rather than relying on country/device/age alone.
